convert_model.py — technical

`scripts/convert_model.py · 65 lines · scripts/convert_model.py`

Purpose

One-off dtype conversion of the base model.

Step by step

Classes and functions in source order. Signatures, line ranges, raised exceptions and settings are extracted from the code; numbered steps describe what the code does.

`main`

```
def main() -> None
```

lines 36-61 · settings MODEL_DTYPE, MODEL_PATH or HF_MODEL_ID

Script entry point: runs this stage end to end.

1. Resolve source, dtype and plugin; `from_pretrained(source, dtype=MODEL_DTYPE)` on CPU with the configured cache.
2. `save_pretrained(--output, max_shard_size)` (standard HF layout, readable by the original-expert reader) and the tokenizer.
3. Write `conversion.json` (source, revision, dtype, parameter count, total safetensors size).
