cli.py — technical

`src/moe_pruning/utils/cli.py · 49 lines · moe_pruning.utils.cli`

Purpose

Script bootstrap.

Step by step

Classes and functions in source order. Signatures, line ranges, raised exceptions and settings are extracted from the code; numbered steps describe what the code does.

`bootstrap`

```
def bootstrap(description: str, stage: str, add_arguments: Callable[[argparse.ArgumentParser], None] |
None=None, argv: list[str] | None=None) -> tuple[argparse.Namespace, ExperimentConfig, ArtifactPaths]
```

lines 19-49 · raises SystemExit · settings EXPERIMENT_NAME, LOG_LEVEL, SEED

Common script start: arguments, config, logging, plugins, seeds, config snapshot.

1. Create the parser with config arguments plus script-specific ones; parse.
2. Build the config (a `ConfigError` prints the message and exits with status 2).
3. Logging to console and `<run_dir>/experiment.log`; import extra model plugins; seed RNGs.
4. Write `<run_dir>/config/<stage>_<UTC timestamp>.json` with argv and the full config.

Errors raised

Function	Exception	Message (f-string fields in braces)
`bootstrap`	SystemExit
